ABSTRACT OF THE DISCLOSURE

A method of delivering a plurality of selectable auction items to a browser of a client computer system. The client computer system downloads a main program that is configured to

5   load onto the client computer system one or modules including a picture displaying module. The picture displaying module obtains, from an auxiliary site, a set of picture pointers to pictures that correspond to auction items listed on a computerized auction site. The picture displaying module obtains the pictures pointed to by the picture pointers and displays the pictures of the items in a moving display on the client computer system. A selection device controls the speed of the

10 moving display and permits the client to select a picture, thereby taking the client computer system to the item description document at the computerized auction system.
